

**China Cones** improve the accuracy of audio systems by reducing resonance. This electronic and mechanical resonance causes subtle phasing errors which reduce fidelity.

**China Cones** are made from a high density ceramic material that does not resonate within the human hearing range, and so vibrational energy is brought under control without audible colouration.

**China Cones** have been specifically designed to acoustically decouple your speakers and audio equipment from shelves and stands, eliminating unwanted but audible resonances that colour the source material: the special cone shape will restore and maintain the integrity of all complex audio signals.

- ✓ Improves frequency response.
- ✓ Better musical definition.
- ✓ Stabilises the stereo image.
- ✓ Adds depth to the sound stage.
- ✓ Reduces room-mode reverberation.
- ✓ Reduces listening fatigue.
- ✓ Used by top recording studios and record producers.
